Game Development Task (2026)

Task Deadline 25 June

Hello, Sophomores! We hope you're all doing well. We're excited to introduce the task round of the CGS (Computer Graphics Society) for Game Development. Below, you'll find two intriguing problem statements, and we encourage you to choose and attempt **at least one of them**. We believe you'll not only have a great time working on these tasks but also gain valuable experience in the world of game development. So, without further ado, let's dive in and get creative!

Problem 1

Game Dev Odyssey: Unleash Your Creativity

Welcome to the exciting world of game development! In this task, you get to unleash your creativity and bring your wildest game ideas to life.

Here's a simplified step-by-step guide:

Step 1: Dream Up Your Game, Your first task is to come up with a game idea. Imagine anything you want, the more imaginative, the better! Think about whether you want to create a 2D or 3D game, what makes your game special, and even the basic storyline (if you have one)

.

Step 2: Pick Your Game Engine Next, you need to choose the software that'll help you build your game. For beginners, we suggest using Unity, but Unreal Engine 5 and Godot are alternate options if you're feeling adventurous.

Step 3: Create a Trial Level Using your chosen game engine, build one level of your game. Think of this level as a sneak peek or a trial version of your game. It's like a demo that shows off what makes your game unique.

The best part? There are no limits to your creativity! The crazier and more imaginative your game idea, the better your chances of standing out.

So, let your imagination run wild, pick your tools, and start creating your very own game. We can't wait to see what you come up with! Good luck! 🎮🚀

Problem 2: Theme-Based Game

Welcome to your second game development challenge! In this task, you'll be working on a game based on a specific theme. We want to see your creativity shine as you put your unique spin on this concept. Here are this year's themes -

1. Everything is a resource

“Everything is a resource” challenges you to rethink what resources can be. Beyond gold or mana, anything—time, movement, emotions, memories, light, sound, relationships, or even mistakes—can become something players manage, spend, trade, or sacrifice. Whether in puzzles, strategy, action, survival, or narrative games, the theme encourages creative systems where every part of the world holds value and every choice matters.

2. Out of the box

“Out of the box” challenges you to break limits, defy expectations, and step outside the rules—literally or figuratively. In this jam, you’re encouraged to think creatively about what it means to go **out of bounds**—whether that’s breaking the fourth wall, escaping a confined space, or twisting game mechanics in unexpected ways.

3. Parallel worlds

Parallel worlds invites players to explore realities that exist side by side—different dimensions, timelines, or versions of the same world. Actions in one world may affect another, forcing players to adapt, solve puzzles, survive, or make choices across multiple realities. Whether shifting between worlds, managing alternate selves, or uncovering hidden connections between dimensions, the theme encourages creative gameplay built around contrast, consequence, and discovery.

4. Impossible space

: "Impossible Space" challenges players to navigate worlds where space itself defies logic. Rooms may be larger inside than outside, paths can loop endlessly, gravity may shift unpredictably, and locations might connect in ways that shouldn't be possible. The theme encourages creative mechanics built around warped geometry, perspective, dimension shifting, and non-Euclidean design—turning exploration, puzzles, and movement into mind-bending experiences.

5. Time Loop

A **time loop** is a narrative or gameplay mechanic where events repeat over and over, with the player or character reliving the same period of time until a certain condition is met like breaking the loop, solving a puzzle, or changing the outcome.

Evaluation Guidelines:

We want to emphasize that the evaluation process is not solely focused on the completion of the game. Whether you complete the game or not is not the primary concern. Instead, we are interested in understanding the effort you put into the project and how effectively you present your work.

Here are some key points to keep in mind:

1. Effort Over Complexity:

- Prioritize effort over complexity. It's okay if your project is simple as long as you've put in sincere effort.

2. Presentation Matters:

- Focus on presenting your game effectively. Ensure you understand every detail of your project and can explain how you've created specific elements.

3. Exploration and Learning:

- We appreciate your willingness to explore and learn. Share what components, code, and assets you've explored during this journey.

4. Task Preference:

- Though we prefer creativity, a successful exhibition of theme based Tasks would not be discriminated.

Lastly, please don't stress over these tasks. They are meant to be enjoyable opportunities for you to showcase your skills and creativity. If you have any doubts or need clarification, don't hesitate to reach out to us. We're here to help and support you throughout this process.

Remember, it's all about having fun and demonstrating your passion for game development!

Here are some links to help you through your Game dev journey:

Documentation:

Unity Docs: [Unity - Manual](https://docs.unity3d.com/Manual/index.html) :<https://docs.unity3d.com/Manual/index.html>

Submissions:

[Submission link will be provided soon](#)

Submission Requirements:

To have your game considered, please prepare and submit three essential components:

1. Devlog:

- Think of the Devlog as a diary for your game project. In this document, introduce your game idea and maintain a record of your daily or weekly progress.
- Include any challenges you encountered, like bugs in your code, and describe how you resolved them.

2. Project Files:

- This includes all the files in your project folder, with a focus on your assets, scenes, and scripts. These are the building blocks of your game.

3. Final Build:

- Compile your game into a playable file. This is the version of your game that others can experience and interact with.
- **Focus on creating a start-to-end Game Prototype with clear win/lose conditions.**

Optional Video (2-3 mins):

- You can choose to create a short video where you explain your game and discuss the scripts you've used. This video adds an extra layer of understanding to your submission.

Important Submission Details:

- Zip all these components into a single file for submission and upload it in Google drive.
- Name your submission file as follows: <Your Name>_<Your Roll No>_<GameDev>. For example, if your name is Sahil and your roll number is 25AI10023, the file should be named "Sahil_25AI10023_GameDev."

Submission Process:

- Please do not submit these files separately, as they will not be considered valid submissions.

We look forward to seeing your creative projects! If you have any questions or need further guidance, don't hesitate to reach out. Good luck with your game development journey!
